SASAI Y., NAKANISHI S.;

J. BIOL. CHEM. 266:15525-15531(1991)
-I - FUNCTION: C/EBP IS A DNA-BINDING PROTEIN THAT RECOGNIZES '
DIFFERENT MOTIFS: THE CCAAT HOMOLOGY COMMON TO MANY PROMO
THE ENHANCED CORE HOMOLOGY COMMON TO MANY ENHANCERS.
-I SUBUNIT: BINDS DNA AS A DIMER.
-I SUBCELLULAR LOCATION: NUCLEAR.
-I TISSUE SPECIFICITY: UBIODITOUSLY EXPRESSED.
-I SINILARIY: TO OTHER BZIP PROTEINS. STRONG, TO OTHER C/EB

SCIENCE 244:569-572(1989).

-!- FUNCTION: THIS ALPHA-ADRENERGIC RECEPTOR MEDIATES ITS A ASSOCIATION WITH G PROTEINS THAT ACTIVATE A PHOSPHATIDY CALCIUM SECOND MESSENGER SYSTEM.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-!- SUBCELLULAR ECCANTION: INTEGRAL MEMBRANE PROTEIN.

rch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Fri Apr 17 13:38:32 1998; MasPar time 6.24 Seconds 626.917 Million cell updates/sec

Description: Perfect Score: Title:

Sequence: >US-08-799-910-10 (1-156) from US08799910.pep 11114 1 MCHSRSCHPTMTILQAPTPA......EPSDYALDLSTFLQQHPAAF 156

Scoring table: PAM 150 Gap 11

Searched: 69112 seqs, 25083644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swiss1

Statistics: Mean 44.412; Variance 91.621; scale 0.485

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr. 114,952). The protein has a mol wt. of solate peptides using affinity chromatography. Antibodies with affinity for NPRB can also be prepd.

 B
 A single-stranded DNA (or its complementary strand or the corresp. C double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the GS 'end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be gequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

 Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an ollgonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which

g,
 Сþ
 PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins pT comprising a binding domain and an effector domain Disclosure; Page 35; 255pp; English.

CC O70468 is a generic DNA sequence used to generate random TSAR (Totally O70468 is a generic DNA sequence used to generate formula can also be represented as follows: X(NNB)11(TGC)(NNB)62(NNB)107 X X CC and Y are flanking restriction sites (X is not the same as Y) that are cont specified further. Other generic sequences are shown in Q70466-68.

CC Other specific peptides generated by these generic sequences are shown in CC comprising at least two functional regions - a binding domain with CC chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or dealing domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, cradicisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromoleules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody sequence 114 BP; 0 A; 2 C; 2 G; 2 T;

RESULT PROCESS OF THE SULT AC OF DE GE
 Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins proteins proceeding a pinding domain and an effector domain proteins proceeding a binding domain and an effector domain proteins processing a binding domain and an effector domain proteins processing a pinding domain and an effector domain proteins proteins or particles. Page 35; 255pp; English.

CC 070467 is a generic DNA sequence used to generate random TSAR (Totally CC graph of the peptides of the peptides formula can also be represented as follows: x(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)12 (NNB)16 (TGC)(NNB)12 (NNB)16 (TGC)(NNB)12 (NNB)16 (TGC)(NNB)12 (NNB)16 (TGC)(NNB)12 (NNB)16 (TGC)(NNB)16 (TGC)

PT Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of pr subject subject produced. CC which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the cC which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the cC subject. The present sequence is an antisense oligonucleotide for the human endothelin-1, targeted at the initiation codon. The cC asthma, chronic obstructive pulmonary disease such as cystic fibrosis, CC airway diseases characterised by an inflammatory response. By clinicating adenosine from the antisense ON, its liberation upon called bronchocomstriction in patients with hyper-reactive airways. | This sequence shows the central portion, including the c-terminus of the alpha-helix region and some of the proline-rich region, of pneumococcal surface protein A (PspA) of Streptococcus pneumoniae strain Bg9739. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against 5. pneumoniae infection and hence for the prevention of diseases such as otitis media, meningitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine Sequence 183 AA; | Streptococcus pneumoniae strain Bg9739.  Sugar beet chitinase 4 and corresponding DNA - inhibits germination and growth of chitin-containing fungi and is used to produce genetically transformed plants
Claim 5; Page 164-168; 254pp; English.
A clone encoding the chitinase 1 gene was isolated from a sugar beet EMBL3 genomic library. The sequence encodes a protein having 439 amino acid residues. Transgenic plants having increased resistance to nematodes and chitin-containing plant pathogens, partic, fungi, can be produced using genetic constructs containing the chitinase 1 gene. The protein itself can be used in fungicidal
 Alpha 1b adrenergic receptor.

 oligonuclotides, antibodies, etc - for determining ligand binding, drug screening and treatment of diseases associated with binding, drug screening and treatment of diseases associated with human alphal adrenergic receptors

Claim 43; Fig 2; 155pp; English.

In order to isolate a full length clone for the alpha 1 adrenergic receptor human cDNA libraries were screened by PCR with primers designed off the isolated genomic clones, from non conserved portions of the receptor gene. The PCR prod. was then used as a probe to isolate the full length alpha 1 adrenergic receptor gene. The gene can be used for screening for abnormalities associated with human alpha 1 adrenergic receptors. e.g. prostatic hypertrophy, coronary heart disease, insulin resistance, hypertension, urinary coronary heart disease, insulin resistance, hypertension, urinary
 retension, glaucoma, erectile dysfunction, Reynaud's syndrome, urinary incontinence and nasal conjestion.

RESULT STANFORM OF Š
 PT Isolated DNA encoding a human N-methyl-D-aspartate receptor subunit - used as probes in the identification and isolation of PT subunit - used as probes in the identification and isolation of PT nucleic acids encoding related receptor subunits.

PS Claim 11; Page 99-104; 156pp; English.

CC 16 (NMDAR2C) gene clone NMDA21. This clone covers the a.a. 249-1040 of CC (RMDAR2C) gene clone NMDA21. This clone covers the a.a. 249-1040 of CC the complete NMDAR2C protein (079372) with the exception of a 17 a.a. CC deletion of a.a. 722-738 of the NMDAR2C sequence. The NMDA receptor contains two subunits: subunit R1 (079370) and subunit R2 selected from CC the subunits 2A (079375), 2B (079377), 2C and 2D (079378). The receptor forms part of a family of NMDA receptors which have cation selective companity and bind glutamate and NMDA. The NMDAR2C gene was obtained by corresponding to sequences in the rat NMDAR2C gene was obtained by corresponding to sequences in the rat NMDAR2A receptor DNA and using the resultant fragments as probes to screen a CDNA library derived from human hippocampal RNA. 4 basic clones were isolated: NMDA21 (079399), NMDA22 (079400), NMDA24 (079401) and NMDA26 (079402). The clones are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants (079403-7) of the NMDAR2C receptor were constructed. The expression of the genes allows the reconstruction of the NMDA CC planes are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants (079403-7) of the NMDAR2C receptor were constructed. The expression of the genes allows the reconstruction of the NMDA CC planes are thought to be paid to a series of variants (079403-7) of the NMDAR2C receptor were constructed. Sequence of the 4 clones, a series of variants (079403-7) of the NMDAR2C receptor were constructed. The compounds which be sequenced to the human NMDA receptor.

 PS Claim 11; Page 99-104; 155pp; English.

CThe amino acid sequence of the novel N-methyl-D-aspartate (NMDA) receptor CC (NMDAR2C). The NMDA receptor contains two subunits: subunit R1 CC (079370) and subunit R2 selected from the subunits 2A (079375), 2B CC (079377), 2C and 2D (079378). The receptor forms part of a family of CC NMDA receptors which have cation selective channels and bind glutamate and MNDA. The NMDAR2C gene was obtained by amplifying cDNA derived from human brain tissues with primers corresponding to sequences in the rat CN NMDAR2A receptor DNA and using the resultant fragments as probes to screen a cDNA library derived from human hippocampal RNA. 4 basic clones covere isolated: NMDA21 (07939), NMDA22 (079400), NMDA24 (079401) and MNDA26 (079402). The clones are thought to be splice variants of each other. Based on the sequence of the 4 clones, a series of variants contern. Based on the sequence of the 4 clones, a series of variants of the genes allows the reconstruction of the NMDA receptor. The complete creceptor can be used to identify compounds which bind or are antagonistic to the human NMDA receptor.
 PT Isolated DNA encoding a human N-methyl-D-aspartate receptor subunit - used as probes in the identification and isolation of production and isolation of production and isolation of production and isolation of production and isolation and isolation of production in the subunits.

Claim 11: Page 99-104: 156pp; English.

PS Claim 11: Page 99-104: 156pp; English.

CC The amino acid sequence of the novel N-methyl-D-aspartate (NMDA) receptor CC (NMDAR2C) gene clone NMDAR2C-delta15-I24. This clone covers the same cc sequence as the NMDAR2C sequence but contains a deletion of a.a. 591-5 (and an insertion of 8 a.a. between a.a. 721-2 of the NMDAR2C protein CC (R66035). A series of variants (079403-7) of the NMDAR2C receptor were constructed, by recombination, based on the sequence of the 4 basic (2010 of the Contain the Sequence of the 4 basic (2010 of the Series of variants (2079403), NMDA24 (2079401) and NMDA26 (2010 of the Series
